Problem Statement

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have **to build an**

algorithm that will detect any bird flying over

Peacetopia and alert the population.

Bird recognition in the city of Peacetopia (case study) The City Council gives you a dataset of 10,000,000 images

Quiz, 15 questions

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

Metric of success

The City Council tells you the following that they want an algorithm that

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

<u>Note</u>: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

	True
0	False

This should not be selected

Quiz, 15 questions

1/1 points

2.

After further discussions, the city narrows down its criteria to:

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

Test Accuracy	Runtime	Memory size
97%	1 sec	3MB

Test Accuracy	Runtime	Memory size
99%	13 sec	9MB

Test Accuracy	Runtime	Memory size
97%	3 sec	2MB

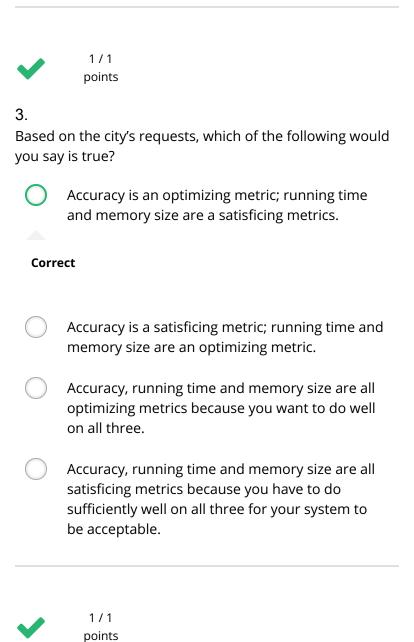

0	Test Accuracy	Runtime	Memory size
	98%	9 sec	9MB

Correct

Bird recognition in the city of Peacetopia (case study)

Quiz, 15 questions

seconds you're good. So, you may simply maximize the test accuracy after you made sure the runtime is <10sec.

Structuring your data

Bird recognision implehencity of Reacot opine (caspistudy)

Quiz, 15 questions

your data into train/dev/test sets. Which of these do you think is the best choice?

Train	Dev	Test
3,333,334	3,333,333	3,333,333

Train	Dev	Test
6,000,000	1,000,000	3,000,000

Train	Dev	Test
6,000,000	3,000,000	1,000,000

0	Train	Dev	Test
	9,500,000	250,000	250,000

Correct

Yes.

×

0/1 points

After setting up your train/dev/test sets, the City Council comes across another 1,000,000 images, called the

Bird recognition in the sity of Reacetopia (case study)

Quiz, 15 questions

so scared of birds that they volunteered to take pictures of the sky and label them, thus contributing these additional 1,000,000 images. These images are different from the distribution of images the City Council had originally given you, but you think it could help your algorithm.

You should not add the citizens' data to the training set, because this will cause the training and dev/test set distributions to become different, thus hurting dev and test set performance. True/False?

test set	t performance. True/False?
0	True
This	should not be selected
	False
~	1/1 points
machir	ember of the City Council knows a little about ne learning, and thinks you should add the 1000 citizens' data images to the test set. You object ne:
	A bigger test set will slow down the speed of iterating because of the computational expense of evaluating models on the test set.
Un-s	elected is correct
	The test set no longer reflects the distribution of data (security cameras) you most care about.

Correct

Bird recognition in the city of Peacetopia (case study)

Quiz, 15 questions	Corre	This would cause the dev and test set distributions to become different. This is a bad idea because you're not aiming where you want to hit.
	Un-se	The 1,000,000 citizens' data images do not have a consistent x>y mapping as the rest of the data (similar to the New York City/Detroit housing prices example from lecture).
		1/1 points in a system, and its errors are as follows (error =

100%-Accuracy):

Training set error	4.0%
Dev set error	4.5%

This suggests that one good avenue for improving performance is to train a bigger network so as to drive down the 4.0% training error. Do you agree?

Yes, because having 4.0% training error shows you have high bias.

Yes, because this shows your bias is higher than your variance.

Bird recognition in the city of Peacetopia (case study)

Quiz, 15 questions

No, because this shows your variance is higher than your bias.

No, because there is insufficient information to tell.

Correct

1/1 points

8.

You ask a few people to label the dataset so as to find out what is human-level performance. You find the following levels of accuracy:

Bird watching expert #1	0.3% error
Bird watching expert #2	0.5% error
Normal person #1 (not a bird watching expert)	1.0% error
Normal person #2 (not a bird watching expert)	1.2% error

If your goal is to have "human-level performance" be a proxy (or estimate) for Bayes error, how would you define "human-level performance"?

0.0% (because it is impossible to do better than
this)

0.3% (accuracy of expert #1)

following:

Human-level performance	0.1%
Training set error	2.0%
Dev set error	2.1%
Test set error	7.0%

Vhat d	oes this mean? (Check the two best options.)
	You should get a bigger test set.
Un-se	elected is correct
	You have underfit to the dev set.
Un-se	elected is correct
	You have overfit to the dev set.
Corre	ect
	You should try to get a bigger dev set.
Corre	ect

After working on this project for a year, you finally achieve: Bird recognition in the city of Peacetopia (case study)

Quiz, 15 questions

Human-level performance	0.10%
Training set error	0.05%
Dev set error	0.05%

What can you conclude? (Check all that apply.) This is a statistical anomaly (or must be the result of statistical noise) since it should not be possible to surpass human-level performance. **Un-selected is correct** If the test set is big enough for the 0.05% error estimate to be accurate, this implies Bayes error is $\leq 0.05\,$ Correct With only 0.09% further progress to make, you should quickly be able to close the remaining gap to 0% Un-selected is correct It is now harder to measure avoidable bias, thus progress will be slower going forward. Correct

Quiz, 15 questions

It turns out Peacetopia has hired one of your competitors to build a system as well. Your system and your competitor both deliver systems with about the same running time and memory size. However, your system has higher accuracy! However, when Peacetopia tries out your and your competitor's systems, they conclude they actually like your competitor's system better, because even though you have higher overall accuracy, you have more false negatives (failing to raise an alarm when a bird is in the air). What should you do?

r). Wl	nat should you do?
	Look at all the models you've developed during the development process and find the one with the lowest false negative error rate.
	Ask your team to take into account both accuracy and false negative rate during development.
This	should not be selected
	Rethink the appropriate metric for this task, and ask your team to tune to the new metric.
	Pick false negative rate as the new metric, and use this new metric to drive all further

0/1 points

You've handily beaten your competitor, and your system is now deployed in Peacetopia and is protecting the citizens

Bird recognition in the city of Peacotopian (case study)

Quiz, 15 questions

bird has been slowly migrating into the area, so the performance of your system slowly degrades because your data is being tested on a new type of data.

You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?

Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new species, and use that to drive further progress for your team.

Put the 1,000 images into the training set so as to try to do better on these birds.

Try data augmentation/data synthesis to get more images of the new type of bird.

This should not be selected

Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.

Dira recogn	101011 111	the city of i caectopia (case state
Quiz, 15 questions	would help work on the Cat detected aren't they you have so that training	ouncil thinks that having more Cats in the city of scare off birds. They are so happy with your need bird detector that they also hire you to build a or. (Wow Cat detectors are just incredibly useful or.) Because of years of working on Cat detectors, such a huge dataset of 100,000,000 cat images on this data takes about two weeks. Which of ments do you agree with? (Check all that agree.)
	go of a ru	100,000,000 examples is enough to build a lood enough Cat detector, you might be better training with just 10,000,000 examples to gain ≈10x improvement in how quickly you can n experiments, even if each model performs a tworse because it's trained on less data.
	Correct	
	ab hy da	aving built a good Bird detector, you should be le to take the same model and perparameters and just apply it to the Cat staset, so there is no need to iterate.
	tea	lying faster computers could speed up your ams' iteration speed and thus your team's oductivity.
	This show	uld be selected
	11113 31101	uiu be selecteu
		eeding two weeks to train will limit the speed which you can iterate.
